Release Notes 2021.01-11 (minor)

This is a minor release with corrections to some bug fixes and introduces improvements.

Bug fixes

✔ The bug appears in the evaluation of some rule conditions
The equality (and not equal) operators, regarding the empty value, were not always treated the same way.
On occasions, depending on the internal representation stored in the database, some conditions could render unexpected results as apparently the field value could be seen as empty visually, but internally it was treated differently.
The fix has consisted in normalizing the evaluation of empty values in the rule conditions, so any field value that appears empty to the user visually (the value is clearly empty) is treated the same way.

New functionality

⭐ The field type **Checkbox** can be compared with the equal operator like the other field types. But it is not clear for the user how it is behaving when comparing empty values.
In order to clarify the behaviour to the CRF editor user, we introduced a new "Checked/Not Checked" operator exclusively for this field type in the rule conditions editor.
